Return the array [5, 4, 2, 3, 1] which is the reverse of the input array. **Function Description** Complete the function reverseArray in the editor below. reverseArray has the following parameter(s): int arr[n]: an array of integers int[n]: the array in reverse order Constraints $1 \le n \le 100$ $0 < arr[i] \leq 100$ **Input Format For Custom Testing** The first line contains an integer, n, the number of elements in arr. Each line i of the n subsequent lines (where $0 \le i < n$) contains an integer, arr[i]. Sample Case 0 **Sample Input For Custom Testing Sample Output Explanation** The input array is [1, 3, 2, 4, 5], so the reverse of the input array is [5, 4, 2, 3, 1]. **Sample Case 1 Sample Input For Custom Testing** Sample Output Explanation The input array is [17, 10, 21, 45], so the reverse of the input array is [45, 21, 10, 17]. Answer: (penalty regime: 0 %) Reset answer * Complete the 'reverseArray' function below. 3 * The function is expected to return an INTEGER_ARRAY. * The function accepts INTEGER_ARRAY arr as parameter. 5 6 7 8 * To return the integer array from the function, you should: 9 - Store the size of the array to be returned in the result_count variable 10 - Allocate the array statically or dynamically 11 12 * For example, 13 * int* return_integer_array_using_static_allocation(int* result_count) { 14 *result_count = 5; 15 16 static int $a[5] = \{1, 2, 3, 4, 5\};$ 17 18 19 return a; 20 21 * int* return_integer_array_using_dynamic_allocation(int* result_count) { 22 *result_count = 5; 23 24 int *a = malloc(5 * sizeof(int)); 25 26 for (int i = 0; i < 5; i++) { 27 ₹ *(a + i) = i + 1;28 29 30 31 return a; 32 33 34 35 v int* reverseArray(int arr_count, int *arr, int *result_count) { 36 *result_count=arr_count; static int rev[100]; 37 38 int i, j=0; 39 for(i=arr_count-1;i>=0;i--) rev[j++]=arr[i]; 40 41 return rev; 42 43 44

for (int i = 0; i < result_count; i++)</pre> 1 printf("%d\n", *(result + i)); 1 Passed all tests! < Question 2 An automated cutting machine is used to cut rods into segments. The cutting machine can only hold a rod of Correct minLength or more, and it can only make one cut at a time. Given the array lengths[] representing the desired Marked out of lengths of each segment, determine if it is possible to make the necessary cuts using this machine. The rod is 1.00 marked into lengths already, in the order given. Flag question Example n = 3lengths = [4, 3, 2]minLength = 7

The rod is initially sum(lengths) = 4 + 3 + 2 = 9 units long. First cut off the segment of length 4 + 3 = 7 leaving a

6. Regardless of the length of the first cut, the remaining piece will be shorter than minLength. Because n - 1 = 2

rod 9 - 7 = 2. Then check that the length 7 rod can be cut into segments of lengths 4 and 3. Since 7 is greater

Expected Got

2

Example n = 3lengths = [4, 2, 3]minLength = 7The rod is initially sum(lengths) = 4 + 2 + 3 = 9 units long. In this case, the initial cut can be of length 4 or 4 + 2 =

> Returns string: "Possible" if all n-1 cuts can be made. Otherwise, return the string "Impossible".

Constraints

 $\cdot \quad 2 \le n \le 10^5$

 $\cdot 1 \le t \le 10^9$

 $1 \le lengths[i] \le 10^9$

Function Description

cuts cannot be made, the answer is "Impossible".

Complete the function *cutThemAll* in the editor below.

int lengths[n]: the lengths of the segments, in order

int minLength: the minimum length the machine can accept

The sum of the elements of lengths equals the uncut rod length.

cutThemAll has the following parameter(s):

Test

int arr[] = {1, 3, 2, 4, 5};

int* result = reverseArray(5, arr, &result_count); 2

than or equal to minLength = 7, the final cut can be made. Return "Possible".

int result_count;

Input Format For Custom Testing The first line contains an integer, n, the number of elements in *lengths*.

Sample Case 0

5

4

3

Sample Input For Custom Testing

 \rightarrow lengths[] size n = 4

→ minLength= 9

Sample Output

Possible

Explanation

Sample Case 1

STDIN Function

 $3 \rightarrow lengths[] size n = 3$

 \rightarrow lengths[] = [5, 6, 2]

 \rightarrow lengths[] = [3, 5, 4, 3]

STDIN Function

Each line i of the n subsequent lines (where $0 \le i < n$) contains an integer, lengths[i].

The next line contains an integer, minLength, the minimum length accepted by the machine.

The uncut rod is 3 + 5 + 4 + 3 = 15 units long. Cut the rod into lengths of 3 + 5 + 4 = 12 and 3. Then cut the 12 unit piece into lengths 3 and 5 + 4 = 9. The remaining segment is 5 + 4 = 9 units and that is long enough to make the final cut.

Sample Input For Custom Testing

 $12 \rightarrow minLength = 12$

Sample Output

Impossible

Explanation

cut.

6

The uncut rod is 5 + 6 + 2 = 13 units long. After making either cut, the rod will be too short to make the second

Answer: (penalty regime: 0 %)

* Complete the 'cutThemAll' function below.

* char* return_string_using_dynamic_allocation() {

char* s = malloc(100 * sizeof(char));

s = "dynamic allocation of string";

if(s>=minLength)return "Possible";

else return "Impossible";

return s;

* The function is expected to return a STRING. * The function accepts following parameters: * 1. LONG_INTEGER_ARRAY lengths * 2. LONG_INTEGER minLength 10 * * To return the string from the function, you should either do static allocation or dynamic * For example, * char* return_string_using_static_allocation() { static char s[] = "static allocation of string"; return s;

char* cutThemAll(int lengths_count, long *lengths, long minLength) {

for(int i=0;i<lengths_count-1;i++)s+=*(lengths+i);</pre>

Got Expected Test long lengths[] = {3, 5, 4, 3}; Possible Possible printf("%s", cutThemAll(4, lengths, 9)) Impossible | Impossible | ✓ long lengths[] = {5, 6, 2}; printf("%s", cutThemAll(3, lengths, 12)) Passed all tests! < Finish review
